Our recent paper (authors.elsevier.com/c/1YEun_WGi1yCM) suggests that #ClimateChange IS NOT the main cause of #LakeUrmia shrinkage. The dramatic increase in upstream #water use due to massive agricultural vegetation expansion is the likely driver of this major environmental disaster in Iran.

Replying to @KavehMadani @waltonwater

This is a superb analysis, showing that the dessication of #LakeUrmia in Iran has been driven by the expansion of irrigation #water withdrawals upstream, and that climatic factors have played only a small or negligible role so far. This is what destroyed the Aral Sea.
